Rust variable
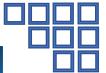

Variables are containers for storing data values

To create a variable, use let

Comments

Comments are the statements that are used for documentation purpose or Comments are ignored by compiler so that don't execute.

There are two types of comments in Kotlin:

▪ Single line comment.

▪ Multi line comment.

➢ Single line comment. [//]

➢ Single line comment is used for commenting single line of statement

➢ Multi line comment [/* */]

➢ Multi line comment is used for commenting multiple line of statement

Print statement

1. Println!()   ----- for a new line .
2. Print!()   ----- no new line .
